## Download the flowers dataset

this tutorial uses a dataset of thousand photos of flowers. The flowers dataset contains five sub-directories, one per class:

flowers\_photos/

daisy/

dandelion/

roses/

sunflowers/

tulips/

Note: all images are licensed by CC-BY, creators are listed in the LICENSE.txt file.

Let's load these images off disk using the helpful `tf.keras.utils.image_dataset_from_directory` utility.

```
In [3]: !wget https://storage.googleapis.com/download.tensorflow.org/example_images/flower_photos.tgz
```

```

```
In [5]: !tar -xvzf flower_photos.tgz > /dev/null
```

After downloading (218MB), you should now have a copy of the flower photos available. There are 3,670 total images:

```
In [6]: from pathlib import Path

data_dir = Path("/content/flower_photos")
```

```
In [7]: image_count = len(list(data_dir.glob('*/*.jpg')))
print(image_count)
```

3670

Define some parameters for the loader

### Create a dataset

```
In [8]: batch_size = 32
img_height = 180
img_width = 180
```

It's good practice to use a validation split when developing your model. You will use 80% of the images for training and 20% for validation

```
In [9]: train_ds = tf.keras.utils.image_dataset_from_directory(
    data_dir,
    validation_split=0.2,
    subset="training",
    seed=123,
    image_size=(img_height, img_width),
    batch_size=batch_size
)
```

Found 3670 files belonging to 5 classes.  
Using 2936 files for training.

```
In [10]: val_ds = tf.keras.utils.image_dataset_from_directory(
    data_dir,
    validation_split=0.2,
    subset="validation",
    seed=123,
    image_size=(img_height, img_width),
    batch_size=batch_size
)
```

Found 3670 files belonging to 5 classes.  
Using 734 files for validation.

You can find the class names in the class\_names attribute on these datasets

```
In [11]: class_names = train_ds.class_names
print(class_names)
```

['daisy', 'dandelion', 'roses', 'sunflowers', 'tulips']

### Visualize the data

Here are the first nine images from the training dataset.

```
In [16]: import matplotlib.pyplot as plt
plt.figure(figsize=(10, 10))
for images, labels in train_ds.take(1):
    for i in range(9):
        ax = plt.subplot(3, 3, i + 1)
        plt.imshow(images[i].numpy().astype("uint8"))
        plt.title(class_names[labels[i]])
        plt.axis("off")
```

daisy

dandelion

roses

dandelion

daisy

sunflowers

sunflowers

dandelion

dandelion

You can train a model using these datasets by passing them to `model.fit` (shown later in this tutorial). If you like, you can also manually iterate over the dataset and retrieve batches of images:

```
In [15]: for image_batch, label_batch in train_ds:
          print(image_batch.shape)
          print(label_batch.shape)
          break
```

```
(32, 180, 180, 3)
```

```
(32,)
```

The `image_batch` is a tensor of the shape `(32, 180, 180, 3)`. This is a batch of 32 images of shape `180*180*3` (the last dimension refers to color channels RGB). The `label_batch` is the tensor of the shape `(32,)`, these are corresponding labels to the 32 images, you can call `.numpy()` on either of these tensors to convert them to a `numpy.ndarray`.

## Standardize the data

The RGB channel values are in the `[0, 255]` range. This is not ideal for a neural network; in general you should seek to make your input values small.

Here, you will standardize values to be in the `[0, 1]` range by using `tf.keras.layers.Rescaling`:

```
In [17]: normalization_layer = tf.keras.layers.Rescaling(1./255)
```

These are two ways to use this layer. You can apply it to the dataset by calling `Dataset.map`:

```
In [18]: normalized_ds = train_ds.map(lambda x, y: (normalization_layer(x), y))
          image_batch, label_batch = next(iter(normalized_ds))
          first_image = image_batch[0]
          # Notice the pixels values are now in `[0,1]`.
          print(np.min(first_image), np.max(first_image))
```

## Configure the dataset for performance

Let's make sure to use buffered prefetching so you can yield data from disk without having I/O become blocking. These are the methods you should use when loading data:

- **Dataset.cache** keeps the images in memory after they're loaded off disk during the first epoch. This will ensure that the dataset does not become a bottleneck while training your model. If your dataset is too large to fit into memory, you can also use this method to create a performant on-disk cache.
- **Dataset.prefetch** overlaps data preprocessing and model execution while training.

Interested readers can learn more about both methods, as well as how to cache data to disk in the *Prefetching* section of the [performance with the tf.data API](#) guide.

```
In [19]: AUTOTUNE = tf.data.AUTOTUNE

train_ds = train_ds.cache().prefetch(buffer_size=AUTOTUNE)
val_ds = val_ds.cache().prefetch(buffer_size=AUTOTUNE)
```

## Train a model

For completeness, you will show how to train a simple model using the datasets you have just prepared.

The `Sequential` model consists of three convolution blocks ( `tf.keras.layers.Conv2D` ) with a max pooling layer ( `tf.keras.layers.MaxPooling2D` ) in each of them. There's a fully-connected layer ( `tf.keras.layers.Dense` ) with 128 units on top, activated by a ReLU activation function ( `'relu'` ). This model has not been tuned in any way—the goal is to show you how to train a model using the datasets you just created. To learn more about image classification, visit the [Image classification](#) tutorial.

```
In [21]: num_classes = 5

model = tf.keras.Sequential([
    tf.keras.layers.Rescaling(1./255),
    tf.keras.layers.Conv2D(32, 3, activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Conv2D(32, 3, activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Conv2D(32, 3, activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Flatten(),
    tf.keras.layers.Dense(128, activation='relu'),
    tf.keras.layers.Dense(num_classes)
])
```

Choose the `tf.keras.optimizers.Adam` optimizer and `tf.keras.losses.SparseCategoricalCrossentropy` loss function. To view training and validation accuracy for each training epoch, pass the `metrics` argument to `Model.compile`.

```
In [22]: model.compile(
    optimizer='adam',
    loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
    metrics=['accuracy']
)
```

```
In [23]: model.fit(
    train_ds,
    validation_data=val_ds,
    epochs=30
)
```

```
